

Safety CoPilot: Site Review, Business Strategy and a Bot-Run Marketing Plan

A step-by-step improvement guide for safety1.ecinc.us, an honest assessment of the business idea and its path to \$10,000 a month nationwide, and an inexpensive marketing engine a bot can run.

Inside: executive summary · site fixes and rebuild steps · business assessment · growth model to \$10k a month · bot-run marketing engine · naming · 30/60/90 plan · paste-ready prompts · 26 toolbox talks · sources

SECTION 1

1. Executive summary

Safety CoPilot is a well-conceived product aimed at a real and growing need: small trade contractors who must prove a safety program to general contractors, insurers and OSHA without a safety manager. The idea can reach \$10,000 a month nationwide. Doing so depends less on new features than on publishing the content, taking payment, saying clearly who the product is for, and running a disciplined, mostly automated marketing loop. Two repository problems need fixing today.

What this report contains

- **Section 2** — the site: two urgent repository fixes, the structure and copy for a marketing site that sells nationwide, sixteen numbered technical and content steps with 'done when' checks, and a launch-readiness checklist.
- **Section 3** — the business idea assessed: demand drivers with 2026 figures, the buyer, the competitors and the gap, positioning, a flat three-tier pricing recommendation, differentiators, risks and questions.
- **Section 4** — the growth model: the arithmetic of \$10,000 a month, a twelve-month ramp, where customers come from, what changes state by state, the product gaps that block revenue, and OSHA's seven-element framework as your safety-culture story.
- **Section 5** — the marketing engine: budgets from \$0 to \$60 a month, a channel map for every channel, the weekly rhythm, the bot architecture, fifteen setup steps, a 90-day calendar, partners, search pages, the email sequence, metrics and guardrails.
- **Section 6** — name, brand and domain.
- **Section 7** — the 30/60/90 day plan on one page.
- **Appendix A** — twelve paste-ready prompts and the setup steps for a Claude Code Routine, Grok Automations and Buffer. **Appendix B** — 26 toolbox talk topics to publish first, with Spanish titles and the standard each rests on. **Appendix C** — sources.

The ten things to do first

1. **Today:** remove `.local-secret` and `db.sqlite3` from the public repository, rotate the secret, change the three passwords, and make the repository private (Section 2.2).
2. **Today:** push the complete source from the command line so the application can be reviewed and tested on every commit.
3. **This week:** decide the product name and register the domain and handles (Section 6). Everything downstream carries the name.
4. **Weeks 1 to 6:** publish the content. Zero of 54 talks and zero of three programs are published; a trial that opens to an empty library ends. Twenty-six reviewed talks in English and Spanish and three finished programs, signed off by a named qualified person.

5. **Weeks 1 to 3:** take payment (Stripe with tax handling), move email to a transactional provider with domain authentication, and add SMS for urgent incident alerts (Section 4.5).
6. **Weeks 2 to 4:** rebuild the marketing site around 'the safety department for contractors too small to have one': home, pricing, trades, free tools, about, security and legal pages (Sections 2.4 and 2.5).
7. **Weeks 1 to 8:** run ECI's own safety program on the product every week and sign five pilot contractors, two with Spanish-speaking crews (Section 3.10).
8. **Weeks 2 to 4:** stand up the marketing engine (brand file, Routine, Buffer, Brevo, free tools) and dry-run it for two weeks (Section 5.6).
9. **Weeks 5 to 6:** launch with founding-member pricing and the 30-day guarantee, announce on every channel the same day, and open the first five partner conversations (Sections 5.7 and 5.8).
10. **Month 3 onward:** monthly review with Prompt P8, add state pages, and turn on paid retargeting only when trial-to-paid exceeds 25% (Section 4.2).

THE ONE NUMBER TO MANAGE

About 67 paying companies at a blended \$150 a month is \$10,000. That needs roughly 1,000 qualified visitors a month, an onboarding call for every trial, and churn held under 3%. Partners and search make the visitors cheap; content and onboarding make the trials convert.

SECTION 2

2. The site: what to fix, in order

This section is the step-by-step improvement guide for safety1.ecinc.us. It starts with two urgent repository fixes, then rebuilds the marketing site around the positioning in Section 3, then hardens the Django application for strangers, then closes with a launch checklist. Steps are numbered in the order to do them.

2.1 What was reviewed and how

- The public repository cnealblack8191/safetypro at commit ef4e164 (16 top-level files uploaded through the GitHub web page: README, environment example, Dockerfile, requirements, launch scripts, and the development database).
- The database schema and seed content (45 tables, 9 requirement rules, 54 toolbox talk records, 3 program worksheets, 60 queued notifications, 2 demo companies, 3 user accounts). No personal data was read or copied.
- Your candidate portal (hire.ecinc.us) and QC field app repositories for ECI's brand, hosting conventions (Apache TLS proxy, PM2 or systemd, Let's Encrypt, Bluehost DNS, AWS) and reusable patterns (offline photo queue, immutable audit trail).
- **Not reviewed:** the live pages. The environment this review ran in blocks safety1.ecinc.us and ecinc.us, and the application folders (templates, views, static files) were not in the repository at the time of writing. Findings that depend on them are marked [verify on the live site].

2.2 Two fixes to make today

1

Remove the secret and the database from the public repository, then rotate

EFFORT: 1 HOUR · OWNER: CHARLES

The upload placed `.local-secret` (an 86-character random token) and `db.sqlite3` (3 user accounts with password hashes, 3 active sessions, company and notification data) on a public GitHub page. Both are listed in `.gitignore`; the web uploader ignores that file. Treat the secret as compromised even if it was only ever used for local preview, because Django signs sessions and password-reset links with it.

Cleanup commands

```
# Run inside the SafetyCoPilot folder on your PC, after the full source is pushed.
# 1) Stop tracking the two files (they stay on your disk, leave GitHub).
git rm --cached .local-secret db.sqlite3
git commit -m "Remove local secret and development database from the repository"
git push

# 2) Remove them from history so the old commit no longer serves them.
#   Easiest: on GitHub, Settings > Danger Zone > delete the repository, create it again
#   (private this time), and push a fresh history:
git checkout --orphan clean
git add .
git commit -m "SafetyCoPilot source"
git branch -D main
git branch -m main
git push -u origin main --force

# 3) Rotate: generate a new local secret and a new server secret.
python -c "import secrets; print(secrets.token_urlsafe(64))"
#   Put the new value in .local-secret locally and in the server's environment
#   (DJANGO_SECRET_KEY), restart the web and worker services, and expect every user to
#   sign in again. Change the three account passwords that were in db.sqlite3.

# 4) Stop it happening again: install a secret scanner as a pre-commit hook.
pip install pre-commit detect-secrets
detect-secrets scan > .secrets.baseline
#   then add detect-secrets to .pre-commit-config.yaml and run: pre-commit install
```

Done when: GitHub shows neither file in any commit; the server runs on a new secret; the three passwords are changed.

2 Push the complete source and make the repository private

EFFORT: 1 HOUR · OWNER: CHARLES

Only the top level of the project reached GitHub. Push from the command line so config/, safety/, templates/, static/, deploy/ and docs/ arrive. Make the repository private: the code, the deployment scripts and the AWS instance identifier in Setup-Administrator.ps1 are not things a competitor or an attacker needs to read.

Push commands

```
# In PowerShell, inside C:\Users\CharlesNBlack\Documents\ChatGPT\SafetyCoPilot
git init
git add .
git commit -m "Full SafetyCoPilot source"
git remote add origin https://github.com/cnealblack8191/safefitypro.git
# (if git says origin already exists: git remote set-url origin <that URL>)
git push -u origin main --force
# --force is safe here because GitHub holds only the partial web upload.
# Then: GitHub > Settings > General > Danger Zone > Change visibility > Private
```

Add the GitHub Actions workflow from your QC repository as a template so python manage.py test and python manage.py check --deploy run on every push.

Done when: The repository is private, contains the full tree, and a green check appears on the latest commit.

2.3 The job of the marketing site

Today the public face is an early-access landing page served by the application in PUBLIC_PRELAUNCH mode, with an interest form that records consent text and campaign tags (the prelaunchlead and prelaunchvisit tables). That is a sound foundation for a waitlist. It is not enough to sell a \$79 to \$249 a month product to a stranger in Texas. The site has to do five things in this order: say who it is for, prove it works, show the price, remove the risk, and collect the email or the trial.

THE FIVE-SECOND TEST

A contractor lands on the home page from a LinkedIn post at 9 pm. Within five seconds they should be able to say: 'This is a safety program tool for small trade contractors like me, made by an electrical contractor, it costs about \$150 a month for my whole company, and I can try it or get a free checklist.' Every step in 2.4 and 2.5 serves that sentence.

2.4 Site structure to build

Page	Purpose	Must contain
Home	Pass the five-second test and route visitors	Hero (2.5), three proof bars, how it works in four steps, the GC packet, the seven-element culture table (Section 4.6), pricing teaser, guarantee, founder line, FAQ, two calls to action repeated
How it works	Show the weekly loop	Screens or a 60-second video: Monday reminders, Tuesday talk with sign-in, inspection with photo, corrective action closed, monthly leadership summary, packet export
For owners / For office managers / For foremen	Speak to each persona	One page each, with the three things that person stops doing by hand
Electrical / HVAC / Plumbing / Low voltage	Trade depth and search traffic	Trade-specific hazards, the talks and programs included, a sample talk to read, a sample packet to download
Pricing	Remove the price question	Three flat tiers, unlimited crew logins, annual discount, founding-member banner with end date, the 40-worker comparison chart, the guarantee, FAQ on seats, sites, cancellation, data export
Free tools	Collect emails	OSHA Readiness Checklist (PDF), Bid-Readiness Score, Toolbox Talk Tuesday signup, site-specific safety plan starter, 300A applicability checker
State pages	Nationwide search traffic	One page per state as described in Section 5.9, dated
About / The ECI story	Trust	1984, Covington, K-12 schools, IEC, the apprenticeship program, the founder's reason for building this, the named qualified reviewer, photos of real crews
Security and data	Answer the insurer and the office manager	Encryption, backups, MFA for operators, immutable records, retention, who can see what, how to export and leave
Legal	Required for nationwide sales	Terms of service, privacy policy, acceptable use, the disclaimer that the product supports but does not certify compliance
Book a call / Start trial	Conversion	A 15-minute onboarding call booking, or the trial signup that already exists at /signup/, with a phone number visible
Blog	Search and proof of expertise	Two articles a month from Prompt P7, on the same domain

2.5 Home page copy, ready to paste

Block	Copy
Eyebrow	For electrical, HVAC, plumbing and low-voltage contractors with 5 to 100 field workers
Headline	The safety department for contractors too small to have one
Subhead	Weekly toolbox talks with sign-in, written programs, training records, incident handling and the packet your GC asks for, run from a phone. Built and used every day by a Georgia electrical contractor on job sites since 1984.
Primary button	Start your 14-day trial
Secondary button	Get the free OSHA readiness checklist
Proof bar 1	Flat price for the whole company. Unlimited crew logins. English and Spanish.
Proof bar 2	Records that survive an inspection: every talk, signature and correction is timestamped and cannot be edited after the fact.
Proof bar 3	One click produces the safety submittal packet general contractors and prequalification networks ask for.
How it works	1. Tell us your trade, crew size and state. 2. Get your written program, your calendar of talks, inspections and reviews, and your reminders. 3. Foremen run Tuesday's talk from a phone; crews sign in. 4. When the GC, the insurer or an inspector asks, download the packet.
The money line	A single serious OSHA citation can cost \$16,550. Registering with ISNetworld costs about \$875 a year before you have produced a single document. Safety CoPilot starts at \$79 a month for your whole company.
Guarantee	Inspection-ready records in 30 days, or we work with you free until you have them.
Founder line	'I have run electrical crews since 1984. We built this because the safety binder never survived contact with a real job site.' Charles Black, Electrical Contractor Inc., Covington, Georgia.
Closing call to action	Start the trial, or take the two-minute bid-readiness score and see where you stand.

Keep every regulatory number with a small source line and a 'checked on' date. Replace the money line's figures when the OSHA penalty table changes each January.

2.6 Step-by-step site improvements

3

Separate the marketing site from the application by hostname

EFFORT: HALF A DAY · **OWNER:** DEVELOPER

Serve the marketing pages at the product domain (for example `www.[name].com`) and the application at `app.[name].com`. Keep `safety1.ecinc.us` as a redirect. This lets you use different analytics, caching and security headers on each, and it stops search engines indexing login pages.

Your QC deployment already runs Apache as a TLS proxy with Certbot renewal hooks; reuse that pattern with two virtual hosts.

Done when: Both hostnames serve over HTTPS with valid certificates; HTTP redirects; the old address redirects to the new one.

4 Rewrite the home page to the copy in 2.5 and add the twelve pages in 2.4

EFFORT: 1 TO 2 WEEKS · **OWNER:** CHARLES AND A DEVELOPER

Start with Home, Pricing, Free tools, About and Legal. Trade and state pages follow in the first month. Every page has one job and one primary button.

Done when: Five people outside ECI pass the five-second test on the home page.

5 Build the three free tools as real forms that write to the lead list

EFFORT: 2 TO 3 DAYS · **OWNER:** DEVELOPER

The prelaunch lead model already stores email, company, interest, source, campaign and consent. Extend it or connect the forms to Brevo. Send the checklist automatically and start the five-email sequence (Section 5.10).

Done when: A test submission arrives in Brevo tagged with its campaign and receives the PDF within one minute.

6 Publish pricing with the comparison chart and the guarantee

EFFORT: 1 DAY · **OWNER:** CHARLES

Use the chart in Section 3.6 and the tier table. State clearly: no per-seat fees, cancel any time, export your data any time.

Done when: The pricing page answers seats, sites, cancellation and data export without a call.

7 Add search basics to every page

EFFORT: 1 DAY · **OWNER:** DEVELOPER

Unique title under 60 characters and meta description under 155; one H1; Open Graph image; canonical URL; `sitemap.xml` via Django's sitemap framework and `robots.txt` that allows the marketing site and disallows the app; JSON-LD for Organization, SoftwareApplication and, on the pricing page, Offer.

Done when: Google Search Console shows the sitemap accepted and no coverage errors.

8 Install analytics and one link convention

EFFORT: HALF A DAY · **OWNER:** DEVELOPER

Use the Umami analytics your candidate portal already references, or Google Analytics 4. Adopt the UTM convention from Section 5.6 step 10. Track four events: checklist download, score completed, trial started, call booked.

Done when: Each of the four events fires in a test and appears in the dashboard.

9 Harden the Django deployment for strangers

EFFORT: 1 DAY · **OWNER:** DEVELOPER

Run `python manage.py check --deploy` and clear every warning: `DEBUG=0`, exact `ALLOWED_HOSTS` and `CSRF_TRUSTED_ORIGINS`, `SECURE_SSL_REDIRECT`, `SECURE_HSTS_SECONDS` (start at 300, raise after a week), secure and `HttpOnly` cookies, `X_FRAME_OPTIONS=DENY`, a Content-Security-Policy header, and `SESSION_COOKIE_AGE` suited to shared field phones. Keep `private-media/` off the web root as the README says.

Rate-limit signup, login and password reset (the `loginattempt` table shows throttling exists for login; extend it). Add a honeypot field to public forms.

Done when: `check --deploy` reports no issues; a header scanner such as securityheaders.com grades A or better [verify on the live site].

10 Fix email before launch

EFFORT: 2 TO 3 DAYS · OWNER: DEVELOPER

Replace the Gmail app-password SMTP setup with Amazon SES (you already run on AWS), Postmark or Resend. Publish SPF, DKIM and DMARC for the sending domain. Send incident alerts from a dedicated subdomain (for example alerts.[name].com) so marketing mail never affects their reputation. Add SMS for the URGENT class.

Done when: Test mail passes SPF, DKIM and DMARC checks and arrives in Gmail and Outlook inboxes; an urgent test alert arrives by SMS.

11 Make the site fast and readable on a phone

EFFORT: 1 DAY · OWNER: DEVELOPER

Compress and resize images (WebP, under 200 KB each), lazy-load below the fold, self-host or preload fonts, and keep the home page under 1.5 MB. Check with Lighthouse on a mid-range Android phone.

Done when: Lighthouse performance above 85 and accessibility above 95 on mobile [verify on the live site].

12 Pass a basic accessibility review

EFFORT: HALF A DAY · OWNER: DEVELOPER

Contrast at least 4.5:1 for body text (ECI red on white passes for large text only; use it for accents, not paragraphs), visible focus states, labels on every form field, alt text on every image, captions on the video, keyboard-only navigation of the signup flow.

Done when: No critical or serious issues in an axe scan; a keyboard-only signup succeeds.

13 Publish the legal and security pages

EFFORT: 2 DAYS PLUS LEGAL REVIEW · OWNER: CHARLES

Terms of service with the support-not-certify disclaimer, privacy policy covering worker records and retention, and the security page. Have a lawyer read the terms once; templates from a reputable generator are a fine starting point.

Done when: All three pages are linked in the footer of every page.

14 Add trust signals that are true today

EFFORT: 1 DAY · OWNER: CHARLES

'Since 1984', IEC membership, 'used daily on ECI job sites', photos of real crews with consent, the qualified reviewer's name and credential, a real phone number and Covington address, links to the ECI company site. Add customer logos and quotes only as they become real.

Done when: Every trust claim on the site can be backed by a document or a person.

15 Instrument the trial so you can see where people stop

EFFORT: 1 TO 2 DAYS · OWNER: DEVELOPER

Track signup started, company created, first employee added, first talk scheduled, first talk completed, first packet downloaded. Email yourself when a trial stalls for three days.

Done when: A funnel report shows each step's completion rate for the last 30 days.

16 Put an uptime monitor and a status line in place

EFFORT: 1 HOUR · OWNER: DEVELOPER

The README notes there is no external uptime monitor. Use a free monitor for the marketing site, the app login page and the worker heartbeat (serviceheartbeat exists). Alert to your phone.

Done when: A deliberate stop of the worker produces an alert within five minutes.

2.7 Inside the application: the ten changes that matter most to buyers

These are product changes visible in the schema and README that affect whether a stranger buys and stays. Section 4.5 covers the deeper platform gaps (payments, email provider, offline, state plans).

1. **Publish the content.** 0 of 54 talks and 0 of 3 programs are published. A trial that opens to empty libraries ends. Ship at least 26 reviewed talks (English and Spanish) and three finished programs before launch.
2. **A first-week onboarding checklist** inside the app: add crew, pick trade, confirm state, schedule the first talk, run it, download the packet. Show progress on the dashboard.
3. **The GC packet export:** one action that bundles the current program versions, training matrix, last 12 weeks of talk reports with signatures, open and closed corrective actions, 300A where applicable, and slots for the COI and EMR letter. Your ZIP export is the start; make it a branded PDF too.
4. **A bid-readiness score** computed from what exists: program reviewed within 12 months, talk completion rate, open corrective actions, expired credentials, 300A posted. Show it to the owner every Monday.
5. **Spanish everywhere the crew touches:** talk text, sign-in screen, reminder messages, quiz questions.
6. **Photo-first inspection** from a phone using the QC field app's uploader and offline queue.
7. **Cert expiry reminders to the employee,** not only the office (the `credential` table has `expires_on`; the `employee` table has an email).
8. **A share link for GC safety directors** to view a company's current packet without an account, expiring in 30 days, logged in the audit table.
9. **Data export and account deletion** on demand, documented on the security page. Buyers' insurers ask; some state privacy laws require it.
10. **Show the audit trail** to the customer: the immutable snapshot and digest already exist in `report`; a visible 'this record has not changed since [date]' line turns an internal safeguard into a selling point.

2.8 Launch-readiness checklist

Area	Ready when
Repository	Private, full source, no secrets, tests and deploy check green on every push
Hosting	Marketing and app hostnames on HTTPS with automatic renewal; backups restored once in a drill; uptime monitor alerting
Application	check --deploy clean; MFA enrolled for operators; payments live; transactional email authenticated; SMS for urgent alerts
Content	26 talks and 3 programs published and signed off by the named qualified person; Spanish reviewed
Site	Twelve pages live; five-second test passed; free tools delivering; analytics events firing; legal pages linked
Proof	ECI running its own program for 30 days; five pilots signed; one video; one written testimonial
Marketing	Brand file, calendar, Routine and Buffer connected; two-week dry run complete; partner conversations started

SECTION 3

3. The business idea, assessed honestly

Safety CoPilot is a good idea aimed at the right customer at the right time. It is also entering a crowded field. This section sets out why it can win, what could sink it, and how to shape the offer so a small contractor sees it as the obvious choice.

3.1 What the product is, in one paragraph

Safety CoPilot (safety1.ecinc.us) is a web application that gives a small specialty contractor the safety department it cannot afford to hire. At launch it should cover the whole compliance loop: a written safety program tailored to the trade, weekly toolbox talks with sign-in, training and certification records with expiry reminders, job hazard analyses and site-specific safety plans, inspections, incident and near-miss reporting, OSHA 300/300A recordkeeping, and a one-click packet of everything a general contractor or insurer asks for. An AI assistant does the drafting, translating and reminding. The company behind it, Electrical Contractor Inc. (ECI), has run commercial electrical crews since 1984 and is its own first customer.

WORKING ASSUMPTION

Your answer to my question was that, at launch, the product should be a complete process for assisting and promoting safety compliance. Everything below is built on that scope, with the small specialty contractor as the first paying customer. If the launch scope is narrower, start with the toolbox talk plus records core and keep the rest as the roadmap you show on the site.

3.2 Why the timing is good: the pressures on a 5 to 100 person contractor

Small contractors do not buy safety software because they love paperwork. They buy it when a general contractor, an insurer, an inspector, or an injury forces the issue. Several of those forces got stronger in 2026.

Pressure	What is true in 2026	What it means for the buyer
OSHA penalties	Maximum \$16,550 per serious violation and \$165,514 per willful or repeated violation. Amounts carried over from 2025 because the fall 2025 shutdown blocked the inflation adjustment. Penalty reductions for small employers were expanded (70% for 11 to 25 employees; 80% on serious-willful for 20 or fewer).	One citation can exceed a month of payroll for a small crew. Documented programs and training are exactly what earns the good-faith reductions.
Georgia workers' comp	As of January 1, 2026 Georgia requires coverage at 3 or more employees (previously 5), officers count, and fines run up to \$2,500 plus \$100 per uninsured employee per day. Electrical contractors sit at the high end of construction rates (\$3.00 to \$8.50 per \$100 of payroll).	Thousands of very small Georgia contractors now carry a policy, an experience modification rate (EMR), and a reason to care about claims history.

Pressure	What is true in 2026	What it means for the buyer
GC prequalification	ISNetworkworld runs about \$875 per year baseline; Avetta \$450 to \$900 for basic tiers and \$1,200 or more for higher ones. Hiring clients demand written programs, training certificates, EMR letters, 300A logs and site-specific safety plans before mobilization.	The paperwork burden lands on an office manager with no safety background. A tool that produces the packet is worth real money.
EMR thresholds	Many owners and GCs require an EMR at or below 1.00, some at or below 0.90. Above 1.0 can disqualify a bid outright.	Safety is a bidding issue, not just a compliance issue. The pitch is revenue protection.
Recordkeeping	Form 300A must be posted February 1 to April 30 and, for construction establishments with 20 to 249 employees, filed electronically by March 2. Employers with 10 or fewer are exempt from routine logs but must still report fatalities and hospitalizations.	Seasonal, deadline-driven demand every January to March that your marketing calendar should own.
Heat rule	OSHA's heat injury and illness prevention standard (proposed August 2024) is not final, but OSHA says it intends to finalize it and issued a revised Heat National Emphasis Program on April 10, 2026. Proposed triggers: heat index 80°F and 90°F, written plan, acclimatization, breaks, training.	Southeast contractors need a written heat plan now. This is a ready-made content series and a template feature.
Injury reality	1,032 construction and extraction fatalities in 2024 (BLS). Falls remain the largest cause (370). Electrocution is roughly 8% of construction deaths, and electricians are among the top trades for electrical fatalities. Nonfatal electrical injuries with days away rose 59% across 2023 to 2024 versus the prior two years (ESFI).	The emotional case is real and specific to your trade. Use it carefully and factually.

Sources for this table are listed in Appendix C (OSHA 2026 penalty memo, Georgia workers' compensation guides, ISNetworkworld and Avetta pricing guides, OSHA recordkeeping FAQs, the OSHA heat rulemaking page, BLS Census of Fatal Occupational Injuries 2024, and ESFI).

3.3 Who buys, and what makes them buy this week

Ideal customer profile

- **Company:** a specialty trade contractor (NAICS 238) with 5 to 100 field workers. Electrical and low-voltage first, then HVAC, plumbing and fire protection. Georgia and the Southeast first.
- **Situation:** bids commercial work through general contractors, carries workers' comp and therefore has an EMR, has no full-time safety manager, and runs the business from a phone as much as a laptop.
- **Crews:** Spanish-speaking workers are common. Bilingual talks, quizzes and sign-ins are a feature, not a nice-to-have.
- **Not the customer (yet):** one to three person residential outfits (no external pressure), firms above 250 employees (they have safety staff and want Procore or HammerTech integrations), and general contractors (a different product, though they are your best referrers).

Three people inside the account

Person	What they care about	What the product must do for them
Owner / operator	Winning bids, insurance cost, not getting the call about an injury, not doing paperwork at 9 pm.	Show the bid-readiness and EMR story. One dashboard. Flat price. A guarantee.
Office manager / bookkeeper	Getting the GC's safety submittal done, chasing expired cards, uploading to ISNetworkworld or Avetta.	One-click packet, expiry reminders, a place where every record already lives.
Working foreman / superintendent	Running the Tuesday talk in three taps, in Spanish if needed, without a laptop or signal.	Phone-first, offline-tolerant, QR sign-in, talk of the week ready to go.

Buying triggers to build the marketing around

- A GC asks for a site-specific safety plan, OSHA 30 competent person, training records or weekly toolbox talk logs before mobilization.
- Registration on ISNetworkworld, Avetta or a similar hiring-client network.
- Insurance renewal, an EMR above 1.0, or a broker asking for a written program.
- An injury, a near miss, or a competitor's OSHA fine in the local news.
- A hiring wave that needs onboarding and orientation records (your candidate portal already does this for ECI).
- Heat season (May to September) and the January to March 300A season.
- Public-owner work, especially K-12 school projects, where safety submittals are strict. ECI's 30 years in that market is a credibility asset.

3.4 The competitive landscape and the gap you can own

Category	Examples and price signals (2026)	Where they fall short for a 5 to 100 person contractor
Enterprise EHS suites	Procore Safety, KPA, J.J. Keller, InteleX. Quote-based, per-user, modular.	Too heavy and too expensive. Built for safety departments, not for an owner and a foreman.
Inspection and checklist apps	SafetyCulture Premium about \$24 per user per month with a free tier. Safesite from about \$4 per user with a free tier. 1st Reporting \$10 per user.	Generic and build-it-yourself. No written program, no trade content, no GC packet. Per-user pricing grows with the crew.
Field reporting tools	Raken Basic about \$15 per user. SiteDocs about \$29 to \$30 per worker.	Form-centric. At 40 workers the bill is \$600 to \$1,200 a month.
AI point tools	AxionSite (AI job hazard analyses), Site Safety AI (\$29.99 flat, photo hazard scan), OSHA Scan, SafetyBuilder.ai and SmarterRisk (program generators), Turner's SafeT Coach (a free AI safety coach opened to the industry in 2026).	Each does one job. None is a system of record. The free coaches teach buyers that advice is free; records, workflow and accountability are what they will pay for.
Safety consultants	Monthly safety management retainers, typically several hundred to a few thousand dollars a month.	Trusted humans, but out of reach for most small shops. A partner and referral channel more than a competitor.
Trade associations	IEC, ABC, AGC, NECA safety programs and libraries.	Excellent content, no software and no records. Partner with them.

THE GAP

Nobody in this list offers, at a flat company price, an all-in-one system that is trade-specific, bilingual, produces the GC submittal packet in one click, keeps inspection-proof records, and is run every day by the contractor who built it. That combination is the position to take.

3.5 Positioning: the sentence the whole site should say

Safety CoPilot is the safety department for contractors too small to have one. It drafts your program, runs your toolbox talks, keeps your records inspection-ready, and hands your GC the packet, built and used every day by a Georgia electrical contractor that has been on job sites since 1984.

Category name to use in copy and search: **safety compliance system for small trade contractors**. Avoid 'EHS software' (nobody in this market searches for it) and avoid leading with 'AI' (it invites the free-chatbot comparison). AI is how it works, not what it is.

Proof points you can legitimately use

- Electrical Contractor Inc., est. 1984, Covington, Georgia. Commercial electrical, service department, and more than 30 years of K-12 school projects.
- Member of the Independent Electrical Contractors (IEC) with an in-house apprenticeship program taught by ECI's own people.

- 'Our own crews run their safety program on it' once that is true. Make it true before launch by using it at ECI for at least 30 days.
- Aligned to 29 CFR 1926 (construction) and NFPA 70E electrical safe work practices. Say 'aligned to', never 'OSHA approved' or 'OSHA certified'. OSHA does not approve software.
- A named qualified person who reviews the content (a CHST, CSP, or OSHA 500-authorized trainer, in-house or fractional). If you do not have one, this is the single most valuable hire or advisor for credibility and liability.

3.6 Offer and pricing recommendation

Recommendation: **flat pricing per company, in three tiers by crew size, unlimited crew logins, annual discount, and founding-member pricing for the first 20 customers.** Small contractors dislike per-seat pricing for field workers who log in once a week, and per-seat pricing punishes the very behaviour you want, which is every worker signed in to every talk.

Tier	Crew size	Price (validate)	What is included
Crew	Up to 15 field workers	\$79 per month, or \$790 per year	Trade-specific written safety program, toolbox talk library with a scheduled weekly talk and phone or QR sign-in, training and certification records with expiry reminders, incident and near-miss log, basic inspections, English and Spanish.
Company	16 to 50	\$149 per month, or \$1,490 per year	Everything in Crew plus AI job hazard analyses and pre-task plans, site-specific safety plan generator, OSHA 300 log and 300A summary, multi-site, and the one-click GC submittal packet (program, training matrix, toolbox log, 300A, EMR letter and COI slots).
Pro	51 to 100	\$249 per month, or \$2,490 per year	Everything in Company plus a quarterly program review call with a qualified person, prequalification upload support (ISNetwork, Avetta), exports and API, priority support.
Add-ons	Any	\$499 one-time; coach credits	Done-with-you setup (program customized, crews loaded, first talk run together). Human review credits for AI-drafted plans on unusual work.

The headline value is simple: at 40 field workers the per-user tools cost six to ten times more than the Company tier. Put that comparison on the pricing page with the competitors' own published numbers and the date you checked them.

Monthly list price for a 40-person field crew (USD)

List prices as published in 2026 pricing guides (SafetyCulture, SiteDocs, Raken, Make Safety Easy). Annual billing and view-only seats can change the real totals; re-check before publishing and cite the date.

Free things that feed the funnel

- **Toolbox Talk Tuesday:** a free weekly bilingual talk by email. This is the marketing engine's spine (Section 5).
- **OSHA Readiness Checklist for Electrical Contractors** (PDF) and a five-minute **Bid-Readiness Score** on the site.
- **Site-specific safety plan starter:** enter a project and get a draft outline. The full generator is the paid feature.
- **Guarantee:** 'Inspection-ready records in 30 days or we work with you free until you are.' It is bold, cheap to honor, and nobody else says it.

3.7 Differentiators that actually matter, ranked

1. **Contractor-built and contractor-run.** Show ECI crews using it: photos, a 60-second video of a foreman running a talk, the founder's story. Nobody can copy 40 years of job sites.
2. **Electrical-first depth.** NFPA 70E-aligned safe work practices, lockout/tagout, arc-flash PPE categories, GFCI and assured grounding, aerial lifts and ladders, trenching for underground feeders. Then HVAC, plumbing and low-voltage packs. Generic tools cannot match this and free chatbots will not be trusted for it.
3. **The GC packet in one click.** The document set GCs, owners and prequalification networks ask for, current and dated. Add a bid-readiness score so the owner sees progress.
4. **Bilingual by default.** Talks, quizzes, sign-ins and reminders in English and Spanish. In Georgia construction this alone can win the deal.
5. **Flat price, unlimited crew.** Everyone signs in, so records are complete, so the packet is complete.
6. **Records that survive an inspection.** Timestamped, signed, versioned, retained. Your candidate portal already stores every quiz attempt with a full audit trail; reuse that pattern. Keep 300 logs five years and training records at least as long as each standard requires.
7. **A human in the loop.** AI drafts, a qualified person reviews. Offer the quarterly coach call, and refer customers to Georgia Tech's free, confidential OSHA On-Site Consultation program. It costs you nothing

and borrows enormous credibility.

8. **Phone-first and offline-tolerant for foremen.** Your QC field app already solved offline photo queues and installable web apps; reuse it.
9. **The insurance angle.** Track leading indicators and produce an underwriter packet at renewal. Insurance agents become a referral channel because they want lower-EMR clients.

3.8 Risks and honest concerns, with mitigations

Risk	Why it matters	Mitigation
Crowded market and free AI coaches	Turner opened a free AI safety coach to the industry in 2026; SafetyCulture and Safesite have free tiers.	Compete on the system, the records, the trade depth and local trust, not on chat. Say plainly on the site what the free tools do not do.
Liability for AI-generated safety content	A wrong control in a JHA can hurt someone and expose ECI.	Qualified-person review before anything is marked final; standards citations on every generated document; version history; clear terms of service and disclaimers; errors-and-omissions insurance for the software business; never imitate OSHA Outreach 10/30 cards, partner with authorized trainers instead.
The name	'Copilot' is Microsoft's brand and a search black hole; 'SafetyPro' is already used by a consulting firm, an enterprise platform and a machine-safety app.	Pick a distinctive product name before public launch, keep 'by ECI' as the trust suffix, and check USPTO, domains and app stores first. Section 6 lists candidates.
Worker data privacy	Names, dates of birth, training records and injury details are sensitive; OSHA 301 privacy-concern cases have special handling.	Role-based access, encryption, a written retention policy, a privacy policy on the site, and a promise never to sell data.
Churn and support load	Small customers churn when onboarding stalls.	Templates, a done-with-you setup product, a 30-day activation checklist, annual plans, a monthly customer webinar.
Founder bandwidth	ECI is a contractor first; the product competes for your time.	Automate marketing (Section 4), hire or contract a part-time safety product lead, and keep the roadmap short.
Regulatory drift	Penalties, rules and dates change every year.	Quarterly content review on the calendar; subscribe to OSHA QuickTakes; date-stamp every regulatory statement on the site.
Domain and brand	safety1.ecinc.us reads as an internal ECI tool.	Fine for a pilot. Move to a product domain before selling to other contractors; redirect the old address.
GC platform lock-in	Some GCs require Procore or HammerTech for their projects.	Position as the subcontractor's own system that exports to whatever the GC uses. Build PDF and CSV exports first, integrations later.

3.9 What 'stands out and attractive' looks like in practice

- **A five-minute proof.** A free bid-readiness score, or a draft site-specific safety plan for a real project, before anyone talks to sales.
- **Show, don't tell.** One 60-second video: a foreman runs a talk in Spanish on a phone, the office manager downloads the GC packet, the owner sees the score go up.
- **Local proof.** Georgia contractor logos, the IEC relationship, the school projects, a Newton County address and a real phone number.
- **Numbers on the homepage.** '\$16,550 per serious citation' next to '\$79 a month'. 'ISNetwork costs \$875 a year just to register; the packet it asks for is one click here.'
- **A named human.** Photo, name and credential of the person who reviews the content and answers the phone.
- **Founding-member pricing and the guarantee,** both with an end date.

3.10 Validate before you scale: a 90-day business plan

1. **Days 1 to 30:** run ECI's own program on the product end to end. Interview ten electrical and low-voltage contractors (owners and office managers) using the script in Appendix A. Ask what a GC asked them for last month and what it cost them in hours.
2. **Days 15 to 60:** sign five pilot customers at no charge for 90 days in exchange for weekly feedback, a testimonial and permission to use their logo. Pick two with Spanish-speaking crews.
3. **Days 30 to 90:** track activation (first toolbox talk logged within 7 days), weekly active foremen, time to first GC packet, pilot-to-paid conversion, and support hours per customer. Convert at least three pilots to founding-member pricing before spending on paid marketing.

Metric	Target at day 90	Why
Activation (first talk logged within 7 days)	80% of new accounts	Predicts retention better than anything else
Weekly active foremen per account	Over 60% of crews	Records are only complete if crews use it
Time to first GC packet	Under 14 days from signup	This is the moment the owner sees the value
Pilot to paid conversion	3 of 5	Proves willingness to pay at your price
Support hours per account per month	Under 1 hour	Protects your bandwidth

3.11 Questions only you can answer

- Is ECI already running its own safety program on Safety CoPilot every week? If not, when?
- Who is the qualified person reviewing the content, and are they willing to be named on the site?
- Will the product live under ECI, or under a separate company for liability and future investment? A separate LLC is common and cheap.

- What is the product name you actually want, and have you checked it for conflicts?
- What is the price you would be comfortable charging a 30-person electrical contractor, and how did you arrive at it?
- Do you have Spanish-language content or a translator you trust?
- How much of your own time per week can go to this for the next six months?

SECTION 4

4. The growth model: \$10,000 a month, nationwide

You set the target at \$10,000 a month in recurring revenue, sold nationwide, to contractors who need compliance help and want a stronger safety culture. This section turns that into numbers, a twelve-month ramp, and the product gaps that must close before a stranger in Texas can pay you with a credit card.

4.1 The arithmetic

Your README already sets the base price at \$149 per company per month. With the three tiers from Section 3 and a realistic mix, the blended price lands near \$140. Add-ons (setup, expert questions, annual prepay) push effective revenue per customer toward \$150.

Blended monthly price	About \$140 (40% Crew at \$79, 45% Company at \$149, 15% Pro at \$249) plus roughly 7% from add-ons, so about \$150 per customer.
Customers needed for \$10,000	About 67 paying companies.
Monthly churn assumption	3% (typical for small-business software with real onboarding). At 67 customers that is two lost a month, so you need two new customers a month just to stand still.
Visitors to trial	2% of qualified visitors start a trial (industry range 1.5% to 3% for focused B2B sites).
Trial to paid	30% with a human onboarding call; 15% to 20% without one. The call is worth it at this price.
Visitors per paying customer	About 170 qualified visitors, so roughly 11,000 to 12,000 qualified visitors across the first year, or about 950 a month on average.

WHAT THIS MEANS

At a \$150 blended price you do not need a viral hit. You need about 1,000 qualified visitors a month, a demo or onboarding call for every trial, and a churn rate you actively manage. Partners and referrals shorten the path because their leads convert at two to three times the rate of cold visitors.

4.2 A twelve-month ramp that reaches \$10,000

Months	Paying customers (end)	Monthly revenue (end)	What has to be true
1 to 2	3 to 5	\$450 to \$750	ECI runs its own program on the product daily. Five pilots signed (three free for 90 days, two paying founding-member price). Payments live. Content published, not drafts.
3 to 4	10 to 14	\$1,500 to \$2,100	First case study and video published. Toolbox Talk Tuesday email past 300 subscribers. Two partner agreements (an insurance agency and an IEC chapter).
5 to 6	22 to 28	\$3,300 to \$4,200	SEO pages ranking for long-tail compliance searches. Referral program live. First customers outside Georgia. Onboarding call for every trial.
7 to 9	40 to 50	\$6,000 to \$7,500	Paid retargeting turned on at \$300 to \$500 a month because trial-to-paid is proven above 25%. Second trade pack (HVAC or plumbing). Five partners referring.
10 to 12	65 to 75	\$9,750 to \$11,250	Annual plans at 30% of the base. Churn under 3%. A part-time customer success person or a well-tuned onboarding sequence.

If month six lands below 15 customers, the problem is almost always one of three things: the trial does not reach the 'first talk logged' moment in the first week, the site does not say who the product is for, or the price is being sold as software instead of as a safety department. Fix those before spending on ads.

4.3 Where the 67 customers come from

Source	Share of customers at scale	Why it works for this product	Cost
Search and content (SEO)	35%	Contractors search at the moment of pain: 'site specific safety plan template electrical', 'OSHA 300A construction 20 employees', 'toolbox talks in Spanish', 'what EMR do GCs require'. Fifty well-built pages compound nationwide for years.	Time; \$0 cash
Partners and referrals	30%	Insurance agents want lower-EMR clients. Trade associations want member benefits. Safety consultants want a system to put clients on. Each partner brings warm, pre-qualified buyers.	20% recurring referral fee or one free month per referral
LinkedIn and social	20%	Owners and GC safety directors live on LinkedIn; foremen and crews on Facebook and Instagram. The bot keeps these fed.	Under \$60 a month in tools
Paid retargeting and search	10%	Only after trial-to-paid is proven. Retarget site visitors and email subscribers; bid on a short list of exact-match compliance terms.	\$300 to \$500 a month from month seven
Local events and Georgia network	5%	Small in number, large in credibility: logos, testimonials, video, and the IEC and AGC relationships.	Under \$100 a month

4.4 Selling nationwide: what changes state by state

A web product can take a customer in any state on day one. Safety rules cannot be treated as identical everywhere, and your README is honest that there are no state-plan rule packs yet. The practical path is to launch nationwide for the 29 states and the District of Columbia where federal OSHA covers private employers, and to label the state-plan jurisdictions clearly as 'federal baseline; state differences not yet covered' until you add packs by demand.

Topic	What varies	What to do
OSHA state plans	Twenty-one states plus Puerto Rico run their own private-sector programs (Alaska, Arizona, California, Hawaii, Indiana, Iowa, Kentucky, Maryland, Michigan, Minnesota, Nevada, New Mexico, North Carolina, Oregon, South Carolina, Tennessee, Utah, Vermont, Virginia, Washington, Wyoming). Standards must be at least as effective as federal but often add requirements, notably California, Washington and Oregon.	Store the customer's state on the company record (you already do). Show a banner and a shorter task set in state-plan states. Add California, North Carolina, Tennessee and Virginia packs first because of contractor density and Southeast adjacency.
Heat rules	California, Washington, Oregon, Colorado, Maryland, Minnesota and Nevada already have enforceable heat standards; the federal rule is still pending with an active National Emphasis Program.	Ship the heat plan template with a state selector. It doubles as a marketing series every May.

Topic	What varies	What to do
Workers' compensation	Thresholds differ (Georgia moved to three employees in 2026; Texas is elective; several states require coverage from the first employee).	Keep a one-page 'state facts' table in the product and on the site, dated and sourced. Do not give legal advice; link to each state board.
Recordkeeping	Federal Part 1904 is adopted by state plans with small variations in posting and electronic submission portals.	The 300A tasks you already schedule are fine nationally; add the state portal link where it differs.
Sales tax on software	Several states tax subscriptions (for example Texas, New York, Pennsylvania, Ohio, Washington). Georgia currently does not tax most software as a service.	Use Stripe Tax or a similar service from day one so nationwide billing does not become a bookkeeping problem later.
Time zones and language	Reminder timing and Spanish-speaking crews everywhere in the trades.	Your company model stores a timezone; make Spanish a first-class toggle for talks, sign-ins and reminders.

State-plan jurisdictions are listed on OSHA's State Plans page; verify the list and the heat-rule states each quarter as part of the content review.

4.5 Product gaps to close before charging strangers

These come straight from the README's 'known boundaries' and from the database you uploaded. They are ordered by how much each one blocks revenue.

Gap	Evidence	Fix	Effort
No way to pay	README: no subscription payments. There is no billing table in the schema.	Stripe Checkout for signup, Stripe Customer Portal for card changes and cancellations, Stripe Tax for state sales tax, webhooks that set the company tier. Founding-member coupon codes.	1 to 2 weeks
No published content	54 talks in the database, 0 published. 48 are placeholder slots for a licensed book; 6 are original starter drafts. The three written programs are drafts.	Either sign the license for the playbook or write and review 26 original talks (six months of weekly talks) before launch, in English and Spanish, with the qualified person's sign-off recorded in the program version history you already have.	3 to 6 weeks of content work
Email is not production-grade	Setup-Gmail.ps1 configures a Gmail app password as the SMTP sender; the outbox has 60 'simulated' notifications and none sent.	Move to a transactional provider (Amazon SES since you are already on AWS, or Postmark or Resend). Authenticate the sending domain with SPF, DKIM and DMARC. Keep Gmail for human replies only. Severe-incident alerts should never depend on a consumer mailbox.	2 to 3 days
Urgent alerts have one channel	README: no SMS. Severe incidents carry 8- and 24-hour federal reporting deadlines.	Add SMS through a provider such as Twilio for the 'URGENT' alert class only, with the email path as the record.	2 to 3 days

Gap	Evidence	Fix	Effort
Marketing site and app share a codebase	PUBLIC_PRELAUNCH mode blocks private routes on a marketing-only deployment.	Fine for now. Give the marketing site its own hostname and the app another (for example www and app) so analytics, SEO and security headers can differ.	1 day
No offline mode for foremen	README: no offline mode. Job sites lose signal.	Reuse the QC field app's pattern: installable web app, queued submissions, retry on reconnect, for the talk sign-in flow first.	1 to 2 weeks
Security readiness items open	README points to docs/SECURITY-READINESS.md for production MFA enrollment, backups and hosting safeguards.	Complete them before the first paying customer outside ECI. Publish a short security page on the site; buyers' insurers ask.	1 week
State-plan awareness	README: no state-plan rule packs.	Banner and reduced task set for state-plan states as described above.	2 days

4.6 Sell safety culture, not paperwork: use OSHA's own framework

OSHA's Recommended Practices for Safety and Health Programs describe seven core elements. Your product already maps to all seven, which is rare for a tool at this price. Put this table on the website and in every sales conversation; it turns 'compliance software' into 'the operating system for a safety culture' and it is accurate.

OSHA core element	What Safety CoPilot already does	What to add or emphasise
Management leadership	Monthly leadership safety meeting task with reminders and a monthly leadership draft for approval.	A one-page monthly scorecard the owner can forward to the GC or insurer.
Worker participation	Talks such as 'Speak up about hazards and near misses'; attendance and individual signatures.	Anonymous near-miss submission from the sign-in screen; recognition of crews with full participation.
Hazard identification and assessment	Daily site inspection task; hazard-driven suggested tasks with explicit applicability review.	Photo-first inspection on a phone (the QC app pattern) and an AI-drafted job hazard analysis.
Hazard prevention and control	Corrective actions with assignment, verification, evidence and reminders.	Overdue-action escalation to the owner; a 'closed on time' metric.
Education and training	Training assignments, credentials with expiry, documentation gaps, toolbox talks.	Bilingual talks; a training matrix export; orientation module reused from your candidate portal.
Program evaluation and improvement	Immutable report snapshots, month-end snapshots, program version histories, annual program reviews.	A bid-readiness score and trend line; quarterly review call on the Pro tier.
Communication on multi-employer sites	ZIP exports with structured data and evidence; PDFs.	The one-click GC submittal packet; a share link a GC safety director can open without an account.

4.7 Ways to grow revenue per customer without raising the price

- **Annual prepay** at ten months for twelve. Cash now, churn later.
- **Done-with-you setup** at \$499: program customized, roster loaded, first talk run together on a call. Most small contractors will pay for this because it is the part they dread.
- **Expert questions** (your tier-three feature) sold as a pack for lower tiers when a customer hits an unusual situation.
- **GC edition** in year two: a general contractor pays for visibility into its subcontractors' compliance and invites them onto the platform. This is how you reach many small subs at once and it raises contract value tenfold.
- **Insurance loss-control partnerships**: carriers and agencies subsidise or bundle safety programs for policyholders. Start with the agents who write your own policies.
- **Referral credit**: one free month for each referred customer who pays for two months.

SECTION 5

5. A marketing engine a bot can run

The plan below costs under \$60 a month in tools until you choose to add paid promotion, runs on every channel you asked for, and needs about twenty minutes of your attention a week once it is set up. It wins Georgia first for proof and credibility while selling nationwide from day one through search, partners and LinkedIn.

5.1 Principles that keep it cheap and effective

1. **One weekly content core, many outputs.** Every week the bot produces one toolbox talk, one compliance-calendar note, one field tip and one business tip. Everything else is a repurposing of those four.
2. **Helpful beats clever.** Contractors follow accounts that save them from a fine or a form. Teach first, sell in the last line.
3. **Every post points to one free thing.** The free thing collects an email. The email sequence sells the trial. The trial gets an onboarding call.
4. **Local proof, national reach.** Georgia logos, faces and events on the site; search and partners carry the message to every state.
5. **Human approval for the first 90 days.** The bot drafts, you approve in one weekly sitting. After 90 days, let the low-risk posts publish automatically and keep approval for anything regulatory.
6. **Measure leads, not likes.** The weekly number that matters is trials started; the monthly number is paying customers.

5.2 Three budgets, pick one to start

Stack	Monthly cost	What you get	When
Zero-cash stack	\$0	Buffer free plan (3 channels, 10 queued posts each), Meta Business Suite for Facebook and Instagram, LinkedIn native scheduler, Google Business Profile posts, Brevo free email (300 sends a day), Canva free, a spreadsheet CRM, Grok or Claude on the plans you already pay for.	Pre-launch and month one
Recommended stack	\$45 to \$60	Buffer Essentials for 7 channels at \$5 each on annual billing (\$35), Brevo free, a free CRM tier (HubSpot or similar), Canva free, your existing AI subscription for drafting. X posting goes through Buffer, so no X API fees.	Launch through month six
Scale stack	\$400 to \$600	Recommended stack plus \$300 to \$500 in retargeting and exact-match search ads, Brevo Starter for automation on a larger list, and a Publora or Buffer API plan if you want the bot to queue posts without you.	Month seven onward, only after trial-to-paid is proven

Prices are the providers' published 2026 rates at the time of writing and are listed in Appendix C. Re-check before you buy.

5.3 Channel map

Channel	Who it reaches	Cadence	Format	Priority
LinkedIn: company page and your personal profile	Owners, GC safety directors, insurance agents, consultants, nationwide	3 posts a week; 1 article a month	Compliance explainers, the weekly talk, customer wins, founder story	1
Facebook: ECItteam page plus a Safety CoPilot page and contractor groups	Owners and foremen, local first	4 posts a week	Field tips with photos, bilingual talk cards, event invites	1
Email: Toolbox Talk Tuesday	Everyone who took a free tool; the list you own	Weekly	One talk in English and Spanish, one compliance date, one product line	1
Website blog and free tools	Search traffic nationwide at the moment of need	2 articles a month; tools ongoing	State pages, template pages, calculators, checklists	1
Google Business Profile	Local search, credibility	1 post a week; ask every customer for a review	Short updates and photos	1
Instagram and Reels	Foremen and crews, recruiting	3 posts a week; 1 reel	Repurposed Facebook content and 30-second clips	2
YouTube: Shorts and long form	Owners researching; foremen learning	1 short a week; 1 long video a month	Product walk-throughs, talk of the week, how to build a GC packet	2
X	Industry press, OSHA news watchers, safety professionals	5 posts a week via Buffer	News commentary, quick tips, links	3
Reddit, contractor Facebook groups, trade forums	Peers asking for help	Manual only, when there is a real question to answer	Helpful replies with no link unless asked	3
Podcasts and trade newsletters	National trade audiences	1 pitch a month	Guest spots on electrical and contractor shows; sponsor a small newsletter	3

5.4 Content pillars and the weekly rhythm

Day	Pillar	Example	Goes to
Monday	Compliance calendar and news	'300A must be posted by February 1. Here is the two-minute version for a 25-person electrical shop.'	LinkedIn, X, Facebook, GBP
Tuesday	Toolbox Talk Tuesday (bilingual)	'Check the ladder before the climb' as a one-page card in English and Spanish, with three pre-task questions.	Email, Facebook, Instagram, LinkedIn, YouTube Short
Wednesday	From the field	A photo from an ECI job with one lesson: 'Why we lock out at the panel, not the breaker you think is right.'	Instagram, Facebook, LinkedIn, X
Thursday	Bid and insurance smarts	'What an EMR of 1.12 costs you on a \$2M school project, and the three records that bring it down.'	LinkedIn, email (monthly), blog
Friday	Product in 30 seconds or a customer win	A screen recording: foreman runs a talk, owner downloads the GC packet.	YouTube Short, LinkedIn, Facebook, X
Monthly	Long form	One LinkedIn article and one blog post from the Thursday pillar; one YouTube walk-through.	LinkedIn, blog, YouTube
Seasonal	Calendar hooks	300A season (January to March), National Safety Stand-Down (May 4 to 8, 2026), National Electrical Safety Month (May), National Safety Month (June), heat season (May to September), Safe and Sound Week (August 10 to 16, 2026).	All channels, planned a month ahead

5.5 The engine: how the bot fits together

Stage	What happens	Tool
1. Sources	OSHA QuickTakes and news releases, the Federal Register heat docket, ESFI and BLS statistics, your own field photos and customer questions, the compliance calendar.	RSS and email subscriptions; a shared photo folder
2. Draft	Once a week the bot runs Prompt P2 and produces the week's batch: every post for every channel, Spanish versions, alt text, hashtags, tracking links, and the newsletter, as one document.	Claude Code Routine, Grok Automations, or a scheduled ChatGPT task (Appendix A)
3. Approve	You read the batch in one sitting, fix anything, and paste approved posts into the scheduler. Twenty minutes.	Your inbox or the marketing repository
4. Publish	The scheduler posts on the calendar. Facebook and Instagram can also schedule natively for free.	Buffer (all channels), Meta Business Suite
5. Capture	Every link carries a campaign tag. Free tools collect an email with consent text (your prelaunch lead model already records consent and campaign).	Website forms, Brevo, CRM
6. Nurture	A five-email sequence sells the trial; the bot drafts replies to comments and questions for you to send.	Brevo automation; Prompt P6 and P9
7. Review	Monthly, paste the numbers into Prompt P8 and get three decisions: what to do more of, what to stop, what to test.	Buffer and Brevo exports, Google Analytics or Umami

Which bot, honestly

Option	What it can do	What it cannot do	Cost
Claude Code Routine (recommended)	Runs on a schedule inside a private marketing repository, reads your brand file and calendar, drafts the full weekly batch, commits it for review, and can call a scheduler's API or MCP server when you are ready to remove the manual paste.	It will not post to a channel unless you give it a scheduler connection; that is a feature during the approval period.	Included in a Claude subscription
Grok Automations	Scheduled prompts on any Grok tier; email-triggered jobs on SuperGrok. Excellent for a daily 'what did OSHA publish today' digest with live X context.	Grok does not publish to X on your behalf; its X connector is read-only. Posting still needs Buffer or an API.	Free; SuperGrok \$30 a month for email triggers
Scheduled ChatGPT tasks	Similar weekly drafting and reminders.	Same posting limitation.	Included in a paid plan
Direct X API	Programmatic posting at \$0.015 per post (\$0.20 if the post has a link) on pay-per-use pricing.	No free tier for new developers; each other network needs its own integration.	About \$5 to \$15 a month at this volume
Buffer API and MCP server	Lets the bot queue posts into Buffer directly across all channels.	Plan-dependent request limits.	Included with Buffer plans in 2026

RECOMMENDED FLOW FOR THE FIRST 90 DAYS

A Claude Code Routine drafts the week every Monday at 6 am and commits a single file to your private marketing repository. You review it over coffee, paste approved posts into Buffer, and send the newsletter from Brevo. A Grok Automation sends you a daily OSHA news digest so the Monday post is always current. After 90 days, connect Buffer's API so approved posts queue themselves.

5.6 Setup, step by step

1 Fix the two security items first

EFFORT: 1 HOUR · **OWNER:** CHARLES

Remove `.local-secret` and `db.sqlite3` from the public repository (commands in Section 2), rotate the secret everywhere it was used, and add a pre-commit check so it cannot recur. Marketing drives strangers to your GitHub and your site; both must be clean.

Done when: The repository shows no secrets or databases and the server runs on a new secret.

2 Decide the product name and secure the handles

EFFORT: 2 HOURS · **OWNER:** CHARLES

Pick the name (Section 3.8 and Section 6). Register the `.com`, and the same handle on LinkedIn, Facebook, Instagram, YouTube, X and TikTok even if you will not use them all yet.

Done when: One name everywhere; the domain resolves to the marketing site.

3 Write the brand file

EFFORT: 2 HOURS · **OWNER:** CHARLES WITH THE BOT

Create `brand.md` in a private marketing repository: audience, voice, the seven positioning sentences, the facts the bot may cite with sources (Prompt P0 contains a starter), the words it may never use, and the visual rules (ECI red and black, photo style, no stock hard-hat clichés).

Done when: Prompt P0 and `brand.md` say the same things.

4 Build the free tools that collect emails

EFFORT: 1 TO 2 DAYS · **OWNER:** CHARLES OR A DEVELOPER

Publish the OSHA Readiness Checklist for Electrical Contractors (PDF), the Bid-Readiness Score (a five-question form that emails a score), and the Toolbox Talk Tuesday signup. Each gets its own landing page with consent text, and each form writes to Brevo with a campaign tag.

Done when: A test signup appears in Brevo with the right tag and receives the welcome email within a minute.

5 Set up Brevo

EFFORT: HALF A DAY · **OWNER:** CHARLES

Create the list, the signup forms, the welcome email, and the five-email nurture automation (Section 5.10). Authenticate your sending domain (SPF, DKIM, DMARC) so mail lands in inboxes.

Done when: Test messages pass an authentication check and arrive in Gmail and Outlook inboxes, not spam.

6 Create Meta Business Suite and connect Facebook and Instagram

EFFORT: 1 HOUR · OWNER: CHARLES

Create the Safety CoPilot Facebook page and Instagram business account; connect both in Business Suite so posts can be scheduled free. Keep the ECItteam page for ECI and cross-post selectively.

Done when: A scheduled test post publishes to both.

7 Create the LinkedIn company page and refresh your personal profile

EFFORT: 1 HOUR · OWNER: CHARLES

Headline: 'Founder, Safety CoPilot. Electrical contractor since 1984. Helping small trade contractors run inspection-ready safety programs.' Add the founder story in About. Turn on Creator mode.

Done when: Company page live with logo, banner and the positioning sentence.

8 Claim Google Business Profile and YouTube

EFFORT: 2 HOURS PLUS VERIFICATION WAIT · OWNER: CHARLES

Claim the profile at the Covington address as a software company with a service area of the United States. Create the YouTube channel and upload the 60-second demo.

Done when: Profile verified; first video live.

9 Connect everything to Buffer

EFFORT: 1 HOUR · OWNER: CHARLES

Connect LinkedIn (page and profile), Facebook, Instagram, Google Business Profile, YouTube and X. Set the posting schedule to the rhythm in Section 5.4 in Eastern time.

Done when: A test post from Buffer appears on every channel.

10 Set up tracking

EFFORT: 2 HOURS · OWNER: CHARLES OR A DEVELOPER

Install Google Analytics 4 or the Umami analytics your candidate portal already uses. Adopt one link convention: ?utm_source=linkedin&utm_medium=social&utm_campaign=ttt-2026-w40. Create a simple dashboard: sessions, signups, trials, paying customers.

Done when: A click from a tagged post shows up in analytics with its source.

11 Create the marketing repository and the weekly Routine

EFFORT: 2 HOURS · OWNER: CHARLES WITH THE BOT

Private GitHub repository with brand.md, calendar.md, facts.md, and a weekly/ folder. Create the Claude Code Routine with Prompt P2 to run every Monday at 6 am Eastern, producing weekly/2026-wNN.md. Create the Grok Automation with Prompt P3 for the daily OSHA digest.

Done when: Two consecutive Mondays produce a usable batch without edits to the prompt.

12 Dry run for two weeks before launch

EFFORT: 2 WEEKS ELAPSED · OWNER: CHARLES

Run the full loop with the waitlist audience: draft, approve, publish, measure. Fix what is clumsy. Record the 60-second demo video and three 30-second shorts.

Done when: Two weeks of posts published on schedule; the video library exists.

13 Recruit the first five partners**EFFORT: 3 WEEKS ELAPSED · OWNER: CHARLES**

One insurance agency, the IEC Atlanta and Georgia chapter partner program, one safety consultant, one supply house, one payroll or bookkeeping firm that serves contractors. Use Prompt P10.

Done when: Five conversations held; two agreements signed.

14 Launch week**EFFORT: 1 WEEK · OWNER: CHARLES**

Announce on every channel the same day; personal LinkedIn post with the founder story; email to your GC, vendor and IEC contacts; Google Business Profile post; a short release to the Covington News and the Atlanta Business Chronicle's people-and-products section; founding-member offer with an end date.

Done when: Launch-week trials counted; onboarding calls booked for each.

15 Turn on the monthly review**EFFORT: 1 HOUR A MONTH · OWNER: CHARLES**

First Monday of each month, run Prompt P8 with the exports and act on its three decisions. Kill any channel under 5% of leads after 90 days unless it costs nothing in time.

Done when: A one-page monthly note exists for each month.

5.7 The first 90 days after launch

Weeks	Focus	Bot output	Your 20 minutes
-2 to 0	Waitlist and dry run	Teasers, founder story, checklist promotion, two weeks of the weekly rhythm	Approve batches; record the demo video
1	Launch	Announcement variants for every channel; email to the list; press note	Personal LinkedIn post; call every trial within 24 hours
2 to 4	Educate	The weekly rhythm; first LinkedIn article ('What your GC actually checks before mobilization')	Approve; answer comments; book partner meetings
5 to 8	Prove	First case study from a pilot; bilingual talk series; EMR explainer video script	Collect the testimonial and logo; ask for Google reviews
9 to 12	Expand	State compliance pages for Florida, Alabama, Tennessee and Texas; referral-program posts; retargeting copy if trial-to-paid is above 25%	Turn on the referral program; decide on paid spend

5.8 Partners and referrals: the cheapest nationwide channel

Partner type	Why they care	The offer	How to find them
Insurance agents and brokers	Lower EMR means better renewals and fewer claims for their book.	20% recurring referral fee or co-branded checklist; a 'loss control' webinar for their clients.	Your own agents first; then agencies that advertise contractor workers' comp in each state.
Trade associations (IEC, ABC, NECA, PHCC, ACCA chapters)	Member benefits and safety programming.	Member discount, a free chapter webinar, a sponsored Toolbox Talk Tuesday.	IEC Atlanta and Georgia partner program first; IEC has chapters nationwide.
Safety consultants	A system to put small clients on instead of spreadsheets.	Reseller margin or referral fee; the Pro tier's quarterly review can be delivered by them.	LinkedIn search by state; OSHA Outreach trainer directories.
Supply houses	Foot traffic and customer loyalty.	Counter-day demos; a QR card at the counter for the free checklist.	Your own branches (Mayer, CED, Graybar, City Electric Supply) first.
Payroll, PEO and bookkeeping firms	They already sell workers' comp and HR compliance to the same owners.	Referral fee; bundle with onboarding.	Local CPA firms and PEO agents who advertise to contractors.
General contractors' safety directors	Fewer late submittals from small subs.	A free GC view of their subs' packets in year two; today, a template pack they can hand to subs.	ECI's own GCs; AGC Georgia Safety Committee.

5.9 Search: the pages that will still bring customers in three years

- **Template and how-to pages** (publish first): site-specific safety plan for electrical contractors; toolbox talk sign-in sheet; competent person letter; OSHA 300A for construction with 20 to 249 employees; heat illness prevention plan template; lockout/tagout program outline; ladder inspection checklist; GC subcontractor safety submittal checklist.
- **State pages** (one per state, start with Georgia, Florida, Alabama, Tennessee, Texas, the Carolinas): OSHA jurisdiction, workers' comp threshold, heat rule status, state consultation program link, and a dated 'last reviewed' line. These rank for 'workers comp requirements [state] contractor' and 'OSHA consultation [state]'.
- **Comparison pages**: 'Safety CoPilot vs SafetyCulture for small contractors', 'vs SiteDocs', 'vs a spreadsheet'. Honest, with their published prices and the date.
- **Free tools**: bid-readiness score, EMR cost calculator, 300A applicability checker. Tools earn links and emails.
- **Technical basics**: one H1 per page, descriptive titles under 60 characters, meta descriptions, Open Graph images, a sitemap, schema.org SoftwareApplication and Organization markup, fast images, and a blog that lives on the same domain as the marketing site.

5.10 The free tool and the five emails that sell the trial

Email	Timing	Subject line	Content
1. Deliver	Immediately	Your OSHA readiness checklist (and the one thing most shops miss)	The PDF, plus the single most common gap you see, plus a reply-to-me question: 'What did your GC ask you for last?'
2. Story	Day 2	Why an electrical contractor built a safety department in software	Founder story, ECI since 1984, the night the paperwork got out of hand. One link to the demo video.
3. Money	Day 5	What one serious citation costs versus a year of Safety CoPilot	\$16,550 versus \$79 to \$249 a month; EMR and bid thresholds; a customer quote if you have one.
4. Proof	Day 8	A foreman ran Tuesday's talk in Spanish in 4 minutes. Here's how.	The 60-second video; the GC packet screenshot; invite to a 15-minute call.
5. Offer	Day 12	Founding-member pricing ends [date]	The guarantee, the price, the end date, one button. Then move them to the weekly Toolbox Talk Tuesday list.

5.11 Numbers to watch

Cadence	Metric	Healthy sign
Weekly	Posts published as scheduled; new email subscribers; site sessions from tagged links; trials started	Over 90% of the planned posts went out; subscribers grow every week; at least one trial a week by month three
Monthly	Trials to paid; paying customers; revenue; cost per trial; churn; top three content pieces by clicks	Trial-to-paid above 25%; churn under 3%; cost per trial under \$50 when paid spend starts
Quarterly	Share of customers by source; partner-referred customers; state mix; review count and rating	Search and partners together above 50% of new customers by quarter four; at least five Google reviews a quarter

5.12 Guardrails for anything the bot writes

- Never say 'OSHA approved', 'OSHA certified' or 'guaranteed compliance'. Say 'aligned to 29 CFR 1926', 'helps you document', 'inspection-ready records'.
- Every regulatory number carries a source and a date; the bot must refuse to invent statistics.
- No customer names, logos, photos or job details without written permission; no photos of injuries or identifiable workers without consent.
- No commentary on politics, lawsuits, or specific companies' OSHA cases beyond what OSHA itself published.
- Spanish versions are reviewed by a fluent person before the first 20 go out; after that, spot-check monthly.

- Alt text on every image, captions on every video.
- Replies to real questions come from a human within one business day; the bot drafts, you send.
- Anything the bot cannot source goes to you as a question, not into a post.

SECTION 6

6. Name, brand and domain

'Safety CoPilot' describes the product well and it is the name in your code, so this section is not an argument to throw it away lightly. It is an argument to check it properly, because 'Copilot' belongs to Microsoft in the public's mind and in search results, and a national launch is the last cheap moment to change.

6.1 The problem with the current name

- Search: 'safety copilot' returns Microsoft Copilot content and Copilot-branded safety integrations. Your pages would compete with Microsoft for your own brand name.
- Trademark: Microsoft holds Copilot marks across software categories. A software product called 'Safety CoPilot' invites a letter, and even a polite one costs money and time at the worst moment.
- Repository and hostnames already vary: SafetyCoPilot (folder), safetypro (repository), safety1.ecinc.us (site). Pick one name and use it everywhere.
- 'SafetyPro' is not an escape: a consulting firm (SafetyPro Resources), an enterprise platform (safetypro24.com) and a machine-safety app already use it.

6.2 Candidate names to check

Candidate	Why it could work	Watch for
SiteReady	Says the outcome (ready for the GC, ready for the inspector). Short, spellable on the phone.	Common word pair; check software marks carefully.
CrewSafe HQ	Crew-first, phone-first. 'HQ' signals the system of record.	'CrewSafe' variants exist in adjacent markets; the 'HQ' suffix may be needed.
ToolboxIQ	Anchors on the toolbox talk, the habit everyone knows.	Sounds like a training-only product; check the IQ-suffix crowd.
PacketReady	Names the one-click GC packet, the feature nobody else sells.	Narrow; the product is more than the packet.
Redline Safety	Electrical heritage (redline drawings), ECI red, memorable.	'Redline' is used by many companies; safety category check required.
Journeyman Safety	Trade credibility, implies experience not theory.	Long; check for training schools with the name.
SafeCrew by ECI	Plain, honest, carries the founder credibility in the name.	'Safe Crew' is generic; the 'by ECI' suffix does the differentiating.
Foreman's Desk	The foreman is the user who makes records complete; 'desk' says system.	Check hospitality and furniture marks; slightly dated feel.

6.3 How to check a name in one afternoon

1. Search the USPTO trademark database for the exact name and close variants in classes 9 and 42 (software and software services). A live registration or pending application in those classes is a stop sign.
2. Search Google for the name plus 'safety', 'construction' and 'app'. Two pages of results with no competing product is the target.
3. Check the .com and the matching handles on LinkedIn, Facebook, Instagram, YouTube, X and TikTok. A hyphenated or suffixed domain is acceptable only if the .com is parked, not if it is a competitor.
4. Check the Apple and Google app stores for the name.
5. Say it on the phone to five contractors and ask them to spell it back. If two get it wrong, drop it.
6. Shortlist three, register the .com for each (about \$15 a year), and choose within a week. Keep 'by Electrical Contractor Inc.' or 'by ECI' as a suffix on the logo and in the footer whatever you choose.

6.4 Tagline options

- The safety department for contractors too small to have one.
- Run safety like a crew, not a binder.
- Inspection-ready. Bid-ready. Every week.
- Built on job sites since 1984.

6.5 Visual identity notes

- Keep ECI's black and red for the 'by ECI' mark; give the product its own primary colour with enough contrast for body text (a deep navy or slate works with red accents). Red is for buttons and warnings, never paragraphs.
- Photography: real ECI crews, real panels and lifts, daylight, no stock hard-hat handshakes. Get written consent from anyone identifiable; blur faces otherwise.
- Typography: one readable sans-serif for the app and the site; the candidate portal's Source Sans 3 is a good choice and already licensed for web use.
- One logo file set: full lockup, icon only, and a one-colour version for embroidery on ECI shirts, which is the cheapest advertising you will ever buy.

SECTION 7

7. The 30/60/90 day plan

One page to pin above the desk. Each cell is a deliverable, not an activity.

Track	Days 1 to 30	Days 31 to 60	Days 61 to 90
Repository and security	Secrets removed and rotated; repository private and complete; CI running tests and deploy check	Pre-commit secret scanning; backup restore drill documented	Quarterly security review scheduled; security page live
Product	Stripe billing; transactional email with SPF, DKIM, DMARC; SMS for urgent alerts; onboarding checklist; state banner	GC packet PDF; bid-readiness score; Spanish sign-in and reminders; cert expiry to employees	Photo-first inspection with offline queue; GC share link; data export and deletion
Content	12 talks and 3 programs finished and signed off; Spanish review process set	26 talks published; heat plan template; first trade pack (electrical) complete	HVAC or plumbing pack drafted; quarterly content review on the calendar
Site	Name chosen; domain and hostnames split; home, pricing, free tools, about, legal live; analytics and events firing	Trade pages; five state pages; first two blog articles; comparison pages	Ten state pages; testimonial and video on home; Lighthouse and accessibility targets met
Marketing	Brand file, calendar, Routine, Grok digest, Buffer, Brevo set up; two-week dry run; five partner outreach emails	Launch week executed; founding-member offer live; Toolbox Talk Tuesday weekly; two partners signed	First case study; referral program; monthly review run twice; paid retargeting decision made
Business	ECI running its program weekly; ten discovery interviews; five pilots signed	Three pilots converted to paying; qualified reviewer named on the site; pricing validated	15 to 25 paying customers; churn and activation measured; first customer outside Georgia

If a cell slips, slip the marketing cells too: promoting a product that cannot take payment or open to a full library wastes the launch.

APPENDIX A

Appendix A. Prompts and bot setup, ready to paste

Everything the bot needs. Prompt P0 is the standing instruction; paste it once at the top of a Grok or Claude project, or save it as brand.md in the marketing repository. The others are the recurring jobs. Square brackets mark the blanks you fill.

P0 — Standing instructions: brand, facts, rules and formats

You are the marketing writer for Safety CoPilot, a safety compliance system for small trade contractors (5 to 100 field workers), built by Electrical Contractor Inc. (ECI) of Covington, Georgia, an electrical contractor since 1984.

AUDIENCE

- Primary: owners of electrical, low-voltage, HVAC and plumbing contractors with 5 to 100 field workers, anywhere in the United States, with no full-time safety manager.
- Secondary: office managers who do the safety paperwork; working foremen who run toolbox talks; general-contractor safety directors and insurance agents who refer customers.

VOICE

- Plain, direct, field-tested. Write like a foreman who has read the standard. Short sentences. No hype, no exclamation marks, no emojis (Instagram may use one).
- Teach first, sell in the last line. Every post gives the reader one usable thing.
- American English. Spanish versions use the natural Spanish spoken on US job sites, not a literal translation.

POSITIONING (use these ideas, vary the words)

- The safety department for contractors too small to have one.
- Built and used every day by a Georgia electrical contractor on job sites since 1984.
- Flat price per company, unlimited crew logins. Bilingual. GC packet in one click. Records that survive an inspection.

FACTS YOU MAY CITE (always with the source; never invent others)

- OSHA maximum penalties for 2026: \$16,550 per serious violation; \$165,514 per willful or repeated violation. Source: OSHA 2026 civil penalty adjustment memo.
- Georgia requires workers' compensation coverage at 3 or more employees as of January 1, 2026. Source: Georgia State Board of Workers' Compensation guidance.
- OSHA Form 300A is posted February 1 to April 30; construction establishments with 20 to 249 employees file it electronically by March 2. Source: 29 CFR 1904.32, 1904.41.
- 1,032 construction and extraction worker fatalities in 2024; falls were the leading cause. Source: BLS Census of Fatal Occupational Injuries, 2024.
- Electrocution is about 8% of construction deaths. Source: OSHA Focus Four.
- ISNetworld registration is about \$875 a year; Avetta \$450 to \$900 for basic tiers. Source: 2026 prequalification pricing guides.
- Many general contractors require an EMR of 1.00 or lower to bid.
- OSHA's Recommended Practices for Safety and Health Programs list seven core elements.

P0 — Standing instructions: brand, facts, rules and formats**NEVER**

- Never write "OSHA approved", "OSHA certified", "fully compliant" or "guaranteed compliance".
- Never invent statistics, quotes, customers or testimonials. If you need a number you do not have, write [NEED SOURCE] and ask.
- Never give legal or medical advice. Point to the standard, the state agency, or the free OSHA On-Site Consultation program.
- Never name a company or person in an OSHA enforcement case unless you link OSHA's own release.
- Never use these phrases: "safety is our top priority", "in today's fast-paced world", "game-changer", "unlock", "revolutionize".

FORMATS

- LinkedIn: 80 to 180 words. First line is a hook under 12 words. Three to five short lines. End with one question or one link. Three hashtags at most.
- Facebook: 40 to 90 words, conversational, one image suggestion, link in the first comment.
- Instagram: caption 30 to 80 words, 5 to 8 hashtags; a six-slide carousel outline when asked.
- X: under 240 characters, at most one hashtag, a link only when necessary.
- Google Business Profile: 40 to 80 words, one call to action.
- YouTube Short script: 45 to 60 seconds, hook in the first 3 seconds, on-screen text.
- Toolbox Talk Tuesday email: subject under 50 characters; preview text; the talk in English then Spanish; one compliance date; one product line; unsubscribe reminder.
- Every post ends with an ALT TEXT line for its image and a LINK line in the form `https://[DOMAIN]/[path]?utm_source=[channel]&utm_medium=social&utm_campaign=[campaign]`

OUTPUT

- Use exactly the headings requested. Mark anything uncertain with [CHECK].

P1 — Monthly content calendar (run on the 25th)

Using the brand rules, plan next month's content calendar for Safety CoPilot.

Inputs:

- Month: [MONTH YEAR]
- Seasonal hooks: [paste from the compliance calendar]
- Product news this month: [notes]
- Last month's three best posts: [paste]
- Target states this month: [for example GA, FL, TN]

Produce a table with one row per weekday: date; pillar (Mon compliance calendar and news, Tue Toolbox Talk Tuesday, Wed from the field, Thu bid and insurance smarts, Fri product or customer win); working title; the one useful thing the reader gets; the free tool or page it points to; channels; the Spanish title for Tuesday.

Then list: the month's LinkedIn article topic; the blog post topic with its target search phrase; the YouTube long-form topic; three photo requests for ECI crews (safe to photograph, no faces required).

Keep every cell under 15 words.

P2 — Weekly batch for every channel (run Monday 6 am)

Produce the weekly batch for week [YYYY-Www] ([Monday date] to [Friday date]) for Safety CoPilot. Follow the brand rules. This week's calendar rows: [paste the five rows from the monthly calendar]

P2 — Weekly batch for every channel (run Monday 6 am)

For each weekday, under a heading with the date and pillar, write:

- 1) LinkedIn post
- 2) Facebook post
- 3) Instagram caption
- 4) X post
- 5) Google Business Profile post (Monday and Friday only)
- 6) YouTube Short script (Tuesday and Friday only)

Tuesday also gets the Toolbox Talk Tuesday email: subject; preview text; the talk (title, 120 to 180 words, three pre-task questions, one sign-in reminder) in English, then the same talk in Spanish; one compliance date in the next 30 days with its source; one product line; the footer.

Every post ends with ALT TEXT: and LINK: lines. Campaign tag: [campaign].

Finish with a REVIEW CHECKLIST: every [CHECK] item, every claim that needs a source, and the three posts you judge strongest. Return everything as one Markdown document.

P3 — Daily OSHA and industry news digest (Grok Automation, weekdays 6:30 am)

Every weekday at 6:30 am Eastern: find items published in the last 24 hours from osha.gov (news releases, QuickTakes, Federal Register notices on heat, recordkeeping, fall protection or electrical safety), ESFI, and the major construction safety outlets.

Return at most five items. For each: a one-sentence plain-language summary; one sentence on why a 5 to 100 person trade contractor should care; the source link; a suggested Monday post angle in under 25 words.

Skip anything without an official or reputable source. If nothing qualifies, say so in one line.

P4 — Monthly LinkedIn article

Write a 700 to 900 word LinkedIn article for Safety CoPilot on:

[topic, for example: What your GC actually checks before letting your crew on site]

Structure: a headline under 12 words; a first paragraph that names the reader's situation; four to six short sections with bold subheads; one table or checklist; a closing that offers the free [tool] and invites replies.

Cite sources inline by document name and year. Use no statistic that is not in the brand facts list or pasted here: [sources].

Then give three alternative headlines and a 40-word LinkedIn post to promote the article.

P5 — Toolbox Talk Tuesday email on its own

Write this week's Toolbox Talk Tuesday email for [date].

Topic: [topic]. Trade focus: [electrical / HVAC / plumbing / all]. State focus: [state or national].

Include: subject (under 50 characters); preview text; the talk in English (title; about 150 words; three pre-task questions; one "what to check today" line); the same talk in Spanish; one compliance date in the next 30 days with its source; a 25-word product line pointing to [link]; one line asking the reader what their crew is working on this week.

P6 — Drafting replies to comments and messages

Here are comments and messages from the last two days:
[paste]

For each, draft a reply in our voice, under 60 words, that answers the actual question, cites a source if the question is regulatory, never promises compliance, and invites a call only if they asked about the product. Flag any that need a human safety professional or that should not be answered publicly.

P7 — Search-optimised article for the site (twice a month)

Write a 1,200 to 1,600 word article targeting the search phrase "[phrase]" for small trade contractors.

Include: a title under 60 characters containing the phrase; a meta description under 155 characters; H2 sections that answer the questions people ask around this phrase; one downloadable template or checklist described in detail; a "state differences" note where relevant; sources cited by name and year with links I can verify; a four-question FAQ; a closing that offers [free tool].

No claims of OSHA approval. Mark every figure with its source or [CHECK].

P8 — Monthly performance review

Here are last month's numbers.

Buffer export: [paste] Brevo export: [paste] Analytics: [paste]

Trials started: [n] New paying customers: [n] Churned: [n] Revenue: [\$]

Using the plan's targets (trial-to-paid above 25%, churn under 3%, search plus partners above 50% of new customers by the fourth quarter), tell me:

- 1) what to do more of (three items, each with the evidence),
- 2) what to stop (up to three),
- 3) one test for next month with its success measure,
- 4) any channel that should be cut under the rule "under 5% of leads after 90 days unless it costs nothing in time".

End with a five-line summary I can paste into my notes.

P9 — Personal follow-up to a new lead

A lead just [downloaded the checklist / took the bid-readiness score and got X / started a trial]. Company: [name]. Trade: [trade]. State: [state]. Size: [n] field workers.

Write a personal follow-up email from Charles, under 120 words, plain text, that refers to their situation, offers one specific useful thing (a template, a state fact, or a 15-minute call), and asks one question. No sales pressure, no bullet points.

P10 — Partner outreach

Write an outreach email to [partner type, for example: an insurance agency that writes contractor workers' compensation in Georgia] from Charles Black, founder of Safety CoPilot and an electrical contractor since 1984.

Under 150 words. Two sentences on what the product does for their clients; one sentence on why it helps them (lower EMR, fewer late submittals, member value); the specific offer [20% recurring referral / co-branded checklist / free webinar for their clients]; a request for a 15-minute call with two proposed times.

P10 — Partner outreach

Then give a three-line LinkedIn connection-request version.

P11 — Customer discovery interview script (Section 3.10)

Customer discovery interview (30 minutes, owners and office managers of 5 to 100 person trade contractors). Ask, listen, do not pitch until the end.

1. Walk me through the last time a GC or owner asked you for safety paperwork. What did they want, who did it, how long did it take?
2. How do you run toolbox talks today? How do you prove they happened?
3. Where do training cards and certifications live? How do you know when one expires?
4. What is your EMR, and has it ever cost you a bid or raised a premium?
5. Are you registered on ISNetworld, Avetta or a similar network? What does it cost you in fees and hours?
6. What happened the last time someone got hurt or nearly got hurt? Who did you call, and what did you write down?
7. How much of your crew prefers Spanish for training?
8. What do you pay today for anything safety-related: software, consultants, training, printing?
9. If a tool did the paperwork and the reminders for \$79 to \$249 a month for the whole company, what would make you say no?
10. Who else should I talk to?

Setting up the Claude Code Routine

Steps

1. Create a private GitHub repository named safetycopilot-marketing with: brand.md (Prompt P0), facts.md (the facts list with links), calendar.md (this month's plan from Prompt P1), prompts/P2.md, and an empty weekly/ folder.
2. In Claude Code on the web, open that repository and create a Routine:

Name: Weekly marketing batch

Schedule: every Monday, 6:00 am Eastern (10:00 UTC in daylight time, 11:00 UTC in standard time; adjust twice a year or accept the one-hour shift)

Prompt: "Read brand.md, facts.md and calendar.md. Follow prompts/P2.md for the current ISO week. Write the result to weekly/<year>-W<week>.md. Do not publish anywhere. Commit, push, and open a pull request titled 'Weekly batch <year>-W<week>' whose description lists the REVIEW CHECKLIST items."
3. Create a second Routine on the 25th of each month at 6:00 am Eastern that runs Prompt P1 and replaces calendar.md through a pull request.
4. Each Monday: read the pull request, edit in place, merge, paste approved posts into Buffer, send the newsletter from Brevo. Twenty minutes.
5. After 90 days, connect Buffer's API or MCP server in the Routine so approved posts are queued automatically once you merge the pull request.

Setting up the Grok Automation

Steps

1. Open Grok, go to Tasks (Automations), choose New.
2. Paste Prompt P3. Schedule: weekdays, 6:30 am Eastern.
3. Delivery: Grok inbox on any tier; email delivery requires the SuperGrok plan.
4. Optional second automation: "Every Friday at 4 pm, list the five most-discussed construction safety topics on X this week with links, and suggest one post angle for each" to feed next week's calendar.
5. Grok does not publish to X on your behalf. Posting goes through Buffer.

Setting up Buffer

Steps

1. Create the Buffer account with the product's email address, not a personal one.
2. Connect: LinkedIn company page, your LinkedIn profile, Facebook page, Instagram business account, Google Business Profile, YouTube channel, X.
3. Settings > Posting schedule: Mon to Fri 7:15 am Eastern for LinkedIn and X; 11:30 am for Facebook and Instagram; Friday 2:00 pm for YouTube Shorts; Monday 9:00 am for Google Business Profile.
4. Paste each approved post into its channel; use Buffer's per-channel customization rather than one identical post everywhere.
5. Weekly, check the Analytics tab and paste the export into Prompt P8 at month end.

APPENDIX B

Appendix B. Twenty-six toolbox talks to publish first

The database holds 54 talk records and none is published. This list is a six-month weekly programme for an electrical contractor, ordered so the highest-risk topics come first. Write each to the same shape: about 150 words, three pre-task questions, one 'check this today' line, and the sign-in. Have your qualified person approve the English and a fluent Spanish speaker approve the Spanish before anything is marked published. Standard references are starting points to verify, not legal citations.

#	Title (English)	Título (Español)	Rests on
1	Lock out and tag out before you touch it	Bloqueo y etiquetado antes de tocar	29 CFR 1926.417
2	Verify zero energy: test before touch	Verifique cero energía: pruebe antes de tocar	NFPA 70E 120.5
3	Arc-flash PPE categories and approach boundaries	Categorías de EPP contra arco eléctrico y límites de aproximación	NFPA 70E 130
4	GFCI protection and assured equipment grounding	Protección GFCI y programa de puesta a tierra	29 CFR 1926.404(b)(1)
5	Extension cords and temporary power	Extensiones eléctricas y energía temporal	29 CFR 1926.405(a)(2)
6	Ladder inspection and setup	Inspección y colocación de escaleras	29 CFR 1926.1053
7	Aerial and scissor lifts: harness, tie-off, ground conditions	Plataformas elevadoras: arnés, anclaje y condiciones del terreno	29 CFR 1926.453
8	Fall protection above six feet	Protección contra caídas a más de seis pies	29 CFR 1926.501
9	Working near overhead power lines	Trabajo cerca de líneas eléctricas aéreas	29 CFR 1926.416, 1926.1408
10	Trenching and excavation for underground feeders	Zanjas y excavaciones para alimentadores subterráneos	29 CFR 1926.651, 1926.652
11	Hazard communication and safety data sheets	Comunicación de riesgos y hojas de datos de seguridad	29 CFR 1926.59
12	Heat illness: water, rest, shade, acclimatization	Enfermedades por calor: agua, descanso, sombra y aclimatación	OSHA Heat NEP; proposed rule
13	Hand and power tool inspection	Inspección de herramientas manuales y eléctricas	29 CFR 1926.300
14	Eye and face protection when cutting and drilling	Protección de ojos y cara al cortar y perforar	29 CFR 1926.102
15	Hearing protection around demolition and generators	Protección auditiva cerca de demolición y generadores	29 CFR 1926.52, 1926.101

#	Title (English)	Título (Español)	Rests on
16	Housekeeping, walkways and material storage	Orden y limpieza, pasillos y almacenamiento de materiales	29 CFR 1926.25
17	Struck-by hazards: cranes, forklifts, deliveries	Golpes por objetos: grúas, montacargas y entregas	29 CFR 1926.600, 1926.1400
18	Confined spaces: vaults, manholes, crawl spaces	Espacios confinados: bóvedas, pozos de registro y entretechos	29 CFR 1926 Subpart AA
19	Silica dust when drilling concrete and block	Polvo de sílice al perforar concreto y bloque	29 CFR 1926.1153
20	Fire prevention and hot-work permits	Prevención de incendios y permisos de trabajo en caliente	29 CFR 1926.150, 1926.352
21	Emergency action: exits, first aid, who to call	Plan de emergencia: salidas, primeros auxilios y a quién llamar	29 CFR 1926.35, 1926.50
22	Near-miss reporting: speak up	Reporte de casi accidentes: hable	OSHA Recommended Practices
23	Driving and trailer safety between jobs	Seguridad al conducir y con remolques entre trabajos	Company policy; FMCSA where applicable
24	Cold, wet and windy conditions	Frío, humedad y viento	General duty; company policy
25	Stop-work authority: anyone can call it	Autoridad para detener el trabajo: cualquiera puede pedirla	OSHA Recommended Practices
26	Job hazard analysis: plan the task before the task	Análisis de riesgos del trabajo: planee la tarea antes de la tarea	OSHA Publication 3071

The shape of a talk that crews will actually sit through

- **Open with the job, not the rule.** 'Today we are pulling feeders in the mechanical room. Here is what can hurt you in there.'
- **One hazard, one habit.** A talk that covers three things teaches none.
- **Three pre-task questions** the foreman asks out loud, and records the answers to: what is energized, who has the lock, where is the nearest exit.
- **One check this today:** a single physical inspection the crew does before starting.
- **Sign-in on the phone**, in the language the worker chooses, tied to the report snapshot your system already makes immutable.
- **Rotate the speaker.** Letting a journeyman lead the talk once a month is the cheapest culture programme there is, and it makes for a good Wednesday post.

APPENDIX C

Appendix C. Sources and how far to trust them

Figures in this report come from the sources below, checked on September 17, 2026. Government and standards sources (OSHA, BLS, the Federal Register, Georgia agencies) are primary. Pricing figures come from vendors' own pages or 2026 pricing roundups and change without notice; re-check any number before you put it on a web page, and print the date you checked it.

Limits of this review

- The live site at safety1.ecinc.us could not be fetched from the environment this review ran in; its network policy blocks that host. Site findings are based on the repository contents that were available, the README, the database schema and seed data, and your description. Anything marked [verify on the live site] should be checked in a browser.
- At the time of writing the repository held only the top-level files of the project (16 files). The Django application folders were not present, so page templates, views and static assets were not reviewed line by line.
- This is not legal, insurance or OSHA compliance advice. Have the qualified person you name in Section 3 review every regulatory statement before it goes on the site.
